

Ultimate Prompting Guide for Video Generation Models

For Kling 0.1, Kling 2.6, Veo 3.1, and LTX Pro

This guide teaches you how to write prompts that work across all major video models. The goal is simple: **tell the model exactly what you want, in the order it needs to understand it**, without overwhelming it.

1. Start With the Core Idea (1–2 sentences)

Start your prompt by making the model understand the *big picture*:

- What is happening?
- Where is it happening?
- What is the mood of the scene?

Example:

“A wide aerial shot of a Lamborghini racing through a busy city at dusk, chased by police cars with flashing lights.”

This sets the scene so the model knows the world, the tone, and the action.

2. Describe the Camera Movement Clearly

Video models pay more attention to camera motion than anything else.

Always define:

- **Start position** (aerial, close-up, over-the-shoulder)

- **Motion path** (glide forward, rotate, zoom in, orbit)
- **End position** (inside the car, front angle, behind the character)

Example:

“The camera tracks the car from above, then glides forward and seamlessly pushes through the windshield into the driver’s cabin.”

Camera instructions make videos feel intentional — not random.

3. Define Characters With Simple, Strong Details

Keep character descriptions short but clear:

- age range
- gender
- general look
- expression or emotion
- what they are doing

Example:

“Inside the car is a handsome man in his late 20s, gripping the wheel with calm confidence. He briefly looks toward the camera.”

Models don’t need essays — they need simple, visual cues.

4. Add a Secondary Character or Object (If Needed)

When showing more than one person, keep details light:

Example:

“In the passenger seat, a beautiful blonde model sits beside him, watching the road.”

Avoid describing faces in too much detail. These models struggle when you over-specify human features.

5. Build the World Around the Scene

Describe only the pieces that matter:

- time of day
- environment
- atmosphere
- lighting
- weather (if it's part of the mood)

Example:

“The city glows with neon signs and warm dusk light reflecting on the car's surface.”

This gives the scene personality without cluttering it.

6. Explain the Lighting and Mood

Lighting is a major signal for realism. Keep it simple:

- soft cinematic lighting
- golden-hour glow
- dramatic shadows

- bright neon reflections

Example:

“Cinematic lighting with warm highlights and deep shadows gives the sequence a dramatic, high-budget look.”

7. Define the Motion of Each Character

Small actions work best:

- turning the head
- looking toward camera
- smiling
- gripping the steering wheel
- leaning slightly

Example:

“The man turns his head toward the camera, then glances at the model in the passenger seat.”

This adds life without overwhelming the model.

8. Keep Visual Style Instructions Simple

If you want a certain look, choose ONE of these and keep it clean:

- realistic
- cinematic
- warm and film-like

- stylized anime
- smooth commercial style
- dramatic action style

Example:

“The video should feel cinematic and realistic, with a smooth, high-budget film style.”

Don’t stack too many styles — it confuses every model.

9. Set the Tone for Motion and Energy

Tell the model how intense the movement should be:

- slow and elegant
- fast and intense
- stable camera
- shaky action cam
- drone-style tracking

Example:

“The motion is smooth and fast-paced, emphasizing the intensity of the chase.”

This helps the model choose the right motion type.

10. Avoid These Common Prompting Mistakes

 Too many adjectives

- ✗ Trying to describe every facial detail
- ✗ Giving three conflicting styles
- ✗ Overloading with camera instructions
- ✗ Mixing moods (“dark and moody but bright and cheerful”)
- ✗ Describing actions that require multiple cuts

Video models excel with **continuous motion**, not edited sequences.

11. The Perfect Prompt Structure (Universal Template)

Here is a structure you can give your community — simple, powerful, and works across all models:

Universal Video Prompt Template

[Scene Setup]

One clear sentence explaining the main idea and mood.

[Camera Movement]

Tell the model where the camera starts, how it moves, and where it ends.

[Characters]

Describe each character briefly: appearance, emotion, and small actions.

[Environment]

Set the world: city, forest, desert, futuristic interior, etc.

[Lighting & Style]

Choose one visual style and describe lighting in a simple way.

[Motion Tone]

Explain whether the scene is smooth, fast, intense, or calm.

12. Example Using the Template

(This matches your Lamborghini scene.)

“A wide aerial shot of a bright yellow Lamborghini racing through a downtown grid at dusk, chased by police cars with flashing lights. The camera tracks the car from above, then glides forward and seamlessly pushes through the windshield into the cabin. Inside is a handsome man in his late 20s, gripping the wheel with calm confidence and briefly looking toward the camera. In the passenger seat sits a beautiful blonde model, focused on the road. The city glows with warm dusk light and neon reflections. The scene is cinematic, fast-paced, and smooth, with dramatic lighting and high-detail realism.”

13. Model-Specific Tips

Kling 0.1 (old version)

- Keep prompts short.
- Too much detail causes flickering.
- One camera movement works best.

Kling 2.6 (new version)

- Can handle longer prompts and complex camera moves.
- Great with faces and motion.
- Responds well to cinematic lighting instructions.

Veo 3.1

- Very strong with realism and smooth detail.
- Keep the prompt balanced — not too long.
- Great with warm lighting and natural motion.

LTX Pro

- Best for stylized, slightly dramatic looks.
 - Keep scene descriptions clean.
 - Good for fast-moving action sequences.
-
