

A FREE GUIDE

How I Prompt Claude *Fable 5*

The Contractor Method — my full system for getting \$10K-looking results from one model. Seven moves, plus 25 copy-paste prompts. No fluff.

Everyone's posting insane Fable 5 demos right now. Minecraft in a browser. One-prompt 3D worlds. Websites that look like a \$10,000 agency build.

Here's what nobody tells you: the people getting those results aren't better prompters. **They just stopped treating Fable 5 like a chatbot.**

Fable 5 is not a chatbot. It's the best contractor you've ever hired — skilled, fast, works alone for hours, doesn't complain. And you get results from a great contractor the same way in AI as in real life: you don't hand them a toolbox and hover. You hand them the job, the standards, and the keys — then you inspect the work.

That's my whole system. Seven moves. I use it for client websites, business tools, my JARVIS assistant — everything.

1 Hand it the job, not the toolbox

The #1 mistake: prompting the *how* instead of the *what*.

Weak prompts read like a to-do list for an intern: "Write the HTML for a hero section. Now add a nav bar. Now make a button." You've turned the smartest model available into a typist — and you've capped the quality at whatever *you* know about web design.

Instead, describe the finished job and who it's for:

✗ "Create a website with a header, hero image, services section, and contact form for a roofing company."

✓ "Build a website for Apex Roofing in Dallas that makes a homeowner with a leaking roof trust them within 5 seconds and call. It should feel like the biggest, most established roofer in Texas — even though they're a 6-man crew."

Same request. The second one gives Fable 5 room to make a hundred good decisions you'd never think to ask for. Notice it also says how the thing should *feel* — Fable 5 is scary good at translating feel into design, pacing, and detail. The guy who got the viral one-prompt starship literally described his dream, not a spec sheet.

2 State your deal-breakers

Handing over the job doesn't mean handing over everything. Every job I give Fable 5 comes with 2–4 deal-breakers — the things it may not touch or violate no matter how creative it gets:

- "Single HTML file. No frameworks, no build step."
- "Never touch anything in /production."
- "Mobile layout is non-negotiable — check it before you tell me you're done."
- "Don't invent testimonials or stats. Leave clearly-marked placeholders."

Freedom on the how, walls around the what-matters. That last one matters more than people think: give a creative model no walls and it will cheerfully fabricate "500+ happy customers" for a client who has 12.

3 Define "done" so a robot could check it

"Make it look professional" is not an instruction — it's a hope. Fable 5 runs long and self-corrects, which means the single highest-leverage thing you can give it is a finish line it can check itself against:

"You're done when: the page loads with zero console errors, every section has a scroll animation, the CTA is visible at every scroll position on a phone-sized screen, and the whole thing works when I double-click the file."

Vague adjectives get you a first draft. Checkable criteria get you a finished product — because the model keeps working until the checklist is true instead of stopping when the output *looks* plausible.

4 Stock the fridge before you leave

Fable 5 can work autonomously for a very long time. The only thing that breaks the run is when it has to stop and ask *you* for something.

So before I send a big job, I stock everything it could need up front: the business name and details, the brand colors, the copy or "write it yourself in this voice," the folder paths, example links for the vibe I want. Every question it doesn't have to ask me is twenty minutes it spends building instead of waiting.

My rule: if I'd hand it to a human contractor on day one, it goes in the prompt.

5 Let it cook

This is the hardest one, and it's a behavior change, not a prompt trick.

Send the job. Close the tab. Make coffee. Fable 5 does its best work on long, uninterrupted runs — it plans, builds, tests its own work, and fixes what's broken. The Pokémon demo everyone shared? Fifty straight minutes, no human input. That's the muscle you're paying for.

Every time you interrupt mid-run to "check in," you're the client who calls the contractor eleven times a day. You don't get a better house. You get a slower, more defensive one.

6 Inspect like a client, not like the builder

When the run finishes, don't review the work in the same conversation that built it. The builder always thinks the house looks great — that's true of models too.

Open a **fresh chat** and play the harshest client:

"You're a Dallas homeowner with a \$15K roof repair and three tabs open comparing roofers. Here's a website. Would you call this company? Score it 1–10 on trust, clarity, and 'do I know what to do next' — and tell me the three things that would make you close the tab."

Fresh context = honest eyes. This one habit is the difference between "AI slop" and work you can charge for. When the inspection finds problems, feed them back as the next job.

7 Stack passes — and keep the receipts

One prompt gets you the skeleton. Passes get you the thing people screenshot.

Pass 1 is the build. Pass 2: "Add the project gallery, the 3-step process section, and a FAQ that answers the top 5 objections roofing customers actually have." Pass 3: whatever the fresh-eyes inspection flagged. The viral starship demo everyone loved? By pass three it had cabinets that opened with items inside. Passes compound.

And when a prompt produces something great — **save it**. Your winning prompts are templates: swap the business name and niche and you've turned one \$2K website build into a repeatable service. That's the part everyone skips, and it's the part that pays. The demo is the receipt; the saved prompt is the business.

THE ANATOMY — STEAL THIS

THE JOB

Build ____ for ____.

THE FEEL

It should feel like ____ / make the user ____.

DEAL-BREAKERS

Non-negotiables: ____, ____, ____.

DONE WHEN

You're finished when: ____, ____, ____ (all checkable).

THE FRIDGE

Here's everything you need: names, copy, colors, paths, links.

Five lines. That's the entire method in template form. **Job, feel, walls, finish line, supplies — then get out of the way.**

One warning before you go build

Fable 5 is only included with paid Claude plans for a limited window — after that it moves to pay-per-use credits. Everything in this guide works on other Claude models too, but if you want to feel the ceiling, run your first Contractor Method prompt on Fable 5 **this week**.

Now — the ammo

The rest of this guide is the prompt pack: 25 copy-paste prompts, all written Contractor-style. Fill in anything in [BRACKETS], paste into Claude Code (or claude.ai) with Fable 5 selected, and let it cook. Where you see **Pass 2**, run it as a follow-up after the first build — that's the stack-passes habit doing its thing.

PART TWO

The Fable 5 Prompt Pack — 25 copy-paste prompts

SECTION 1

Websites That Win Clients

The "\$10K look" for local businesses. This is the fastest path from prompt to paycheck.

1. The \$10K local business site

Build a complete one-page website for [BUSINESS NAME], a [roofing company] in [CITY]. It should feel like a \$10,000 agency build: a cinematic hero section that loads with impact, smooth scroll-triggered reveals on every section, social proof, a sticky "Get a Free Quote" call-to-action, and flawless mobile layout. Premium, trustworthy color palette that fits the trade. Deliver it as a single HTML file I can open in any browser. The first screen should make the owner say "that's MY company?!"

PASS 2 → Add a before/after project gallery, a 3-step "How We Work" section, and a FAQ that pre-handles the top 5 objections customers in this trade actually have.

2. The personal brand site

Build a personal brand website for [NAME], a [what you do]. It should feel confident and modern — bold typography, generous whitespace, one accent color, subtle motion as I scroll. Sections: who I am, what I've built (3 case studies), what people say, and one clear way to work with me. Single HTML file. It should feel like the website of someone who charges more than everyone else in their market.

PASS 2 → Add a dark/light mode toggle and a sticky nav that shrinks on scroll.

3. The restaurant site that makes people hungry

Build a website for [RESTAURANT NAME], a [cuisine] restaurant in [CITY]. Warm, appetizing, editorial feel — like a food magazine came to life. Hero with the signature dish front and center, a menu section that's easy to scan on a phone, hours and location impossible to miss, and a "Reserve a Table" button that follows you. Single HTML file.

PASS 2 → Add a photo gallery section with a soft parallax effect and a "What locals say" review strip.

4. The SaaS landing page

Build a landing page for [PRODUCT], a tool that [what it does] for [who it's for]. It should feel like a modern SaaS launch: sharp headline that leads with the outcome, animated product mockup section, 3 benefit blocks, pricing table with a highlighted recommended tier, and an FAQ. Clean, minimal, one accent color. Single HTML file. A visitor should understand what this does within 5 seconds.

PASS 2 → Add a comparison table ("Us vs. the old way") and one subtle animated element in the hero that makes the page feel alive.

5. The real estate listing showcase

Build a single-property showcase page for [ADDRESS / PROPERTY TYPE]. Luxury-listing energy: full-width photo hero, elegant serif headlines, a stats bar (beds, baths, square footage, price), a story-driven description section, neighborhood highlights, and a "Book a Private Tour" form. Single HTML file. It should feel like the property costs more just because of this page.

PASS 2 → Add an image carousel with keyboard and swipe support, and a mortgage estimate widget.

SECTION 2

Client Tools You Can Charge For

Small internal tools businesses will happily pay monthly for.

6. The review-response dashboard

Build a single-file web app for a [business type] owner to manage customer reviews. Paste in a review, pick a tone (grateful / apologetic / professional), and it generates a ready-to-post response following review-response best practices. Include a history panel of past responses. Clean dashboard feel, zero learning curve — a busy owner should get value in the first 30 seconds.

7. The quote & invoice generator

Build a single-file web app for a [trade, e.g. landscaping] business to create quotes and invoices. Line items with quantity and price, automatic totals and tax, the business logo and details at the top, and a one-click "Print / Save as PDF" view that looks professional enough to send to a customer. Data saves in the browser so nothing is lost on refresh.

8. The lead-intake machine

Build a lead-intake web app for a [business type]: a beautiful multi-step form customers actually finish (one question per screen, progress bar, friendly microcopy), plus an admin view listing every lead with status tags (new / contacted / booked). Single HTML file, data stored in the browser. The form should feel premium — like the business has its act together.

9. The website audit report

I'm going to give you a local business website URL: [URL]. Analyze it and produce a client-ready audit report as a polished HTML page: overall score, what's hurting them (speed, mobile, trust signals, calls-to-action, basic SEO), what it's costing them in plain English, and a prioritized fix list. Professional and direct, but written so a non-technical owner understands every line. This report should make them want to hire someone to fix it.

WHY → *This is exactly how I prospect — audit first, pitch second.*

10. The monthly client report

Build a one-page HTML progress report template for my [service] clients. Sections: what we did this month, the numbers that moved (with simple charts), what it means in dollars, and what's happening next month. Design it so the client's first reaction is "this is why I pay them." Make every section easy for me to update by editing clearly-marked placeholders.

SECTION 3

Showstoppers

The "post it on X" builds. These are for wow, practice, and content.

11. Your dream scene

Build an explorable 3D scene of [YOUR DREAM SCENE — e.g. "a cozy mountain cabin at night during a snowstorm"] in Three.js, running in a single HTML file. First-person controls. I care most about how it FEELS: [e.g. "warm light from the windows, snow drifting past, a fireplace crackling, the sense that I could live there"]. Add small interactions that reward exploring. Surprise me with one detail I didn't ask for.

PASS 2 → *Add three more interactive objects, ambient sound, and something happening outside that I can watch through a window.*

12. The honest voxel world

Build a voxel sandbox world in a single HTML file using Three.js: infinite procedurally-generated terrain with several biomes, caves, a day/night cycle, and first-person mining and block-placing with a hotbar of block types. No mobs or crafting needed — focus on making the world feel alive: lighting, ambient sound, and little touches like falling sand. It should make someone say "wait, this runs in a BROWSER?"

13. The retro arcade game with juice

Build a browser arcade game: [e.g. "a neon space shooter"]. What matters most is FEEL — snappy controls, screen shake on hits, particles everywhere, satisfying sound effects, a combo system, and a game-over screen that makes me hit restart immediately. Single HTML file. Make the first 10 seconds fun.

14. The physics toy

Build an interactive simulation of [e.g. "our solar system"] in a single HTML file — real physics driving the motion, not canned animation. Let me speed up time, click any object to focus and see live data, and toggle orbit trails. It should feel like a museum exhibit: beautiful, accurate, and impossible to stop playing with.

15. The self-composing music visualizer

Build a single-file music visualizer that COMPOSES its own ambient music in code (no audio files) and renders visuals that react to what it's playing. Give me a few mood presets (calm / focus / epic). It should feel hypnotic — the kind of thing someone leaves running on a second monitor.

SECTION 4

Your AI Employee

The JARVIS direction: stop prompting, start delegating. Best run in Claude Code.

16. The second-brain librarian

Here's a folder of my notes: [FOLDER PATH]. Organize it into a clean knowledge base: consistent naming, an INDEX file that maps everything, links between related notes, and a stubs list of topics I reference but never wrote down. Don't delete anything — restructure and report what you changed and what's missing.

17. The morning briefing

Read [my task list / project folder / notes] and write me a morning briefing: the 3 things that matter most today and why, anything that's been sitting too long, and one risk I'm not seeing. Keep it under 200 words, direct, no fluff. Talk to me like a sharp chief of staff, not a cheerleader.

18. The inbox triage assistant

Here are [N] emails I need to handle: [PASTE]. Sort them into: needs my brain, can be answered with a template, can be ignored. Draft replies for the template ones in my voice — short, warm, direct. Flag anything that smells like an opportunity worth more than the rest combined.

19. The content multiplier

Here's the script/transcript of my latest video: [PASTE]. Turn it into: 3 tweet-length hooks, 1 X thread, 1 LinkedIn post, and 1 short newsletter. Keep MY voice — high energy, direct, receipts over hype. Each piece should stand alone; don't just summarize the video, re-angle it for each platform.

20. The competitor radar

Research what [3 COMPETITORS / CHANNELS] published in the last 2 weeks: [LINKS]. Report: what's working for them (and the pattern behind it), what they're all missing, and the top 3 moves I should make that none of them are doing. End with one contrarian take I could publish this week.

SECTION 5

Money Prompts

You built the thing. Now sell it.

21. Package the offer

I built [WHAT YOU BUILT] for [NICHE]. Package it as a service: name the offer, define what's included, and give me three price tiers (one-time build / build + monthly care / premium done-for-you) with the psychology behind each price. Then tell me which tier to anchor first and why.

22. The cold email that doesn't feel cold

Write a cold email to [BUSINESS NAME] in [CITY]. I've reviewed their website and found: [2–3 SPECIFIC ISSUES]. The email must reference those issues specifically (so it can't be mistaken for spam), offer one piece of free value up front, and end with a low-pressure ask. Under 120 words. Tone: local, helpful, confident — not "agency-speak."

23. The proposal in one prompt

Write a one-page proposal for [CLIENT] based on this situation: [WHAT THEY NEED + WHAT YOU'LL BUILD]. Structure: their problem in their words, what I'll deliver (specific, dated), what it costs, what happens if they do nothing, and next steps that make saying yes easy. No filler.

24. The demo video script

Write me a 60-second demo script for [THE TOOL I BUILT], aimed at [NICHE] owners. Open with the money problem it solves, show the tool in 3 quick beats, end with one clear call to action. Conversational, high-energy, zero jargon — write it to be read out loud, not read on a page.

25. The 30-day authority plan

I serve [NICHE] with [SERVICE]. Build me a 30-day content calendar: one short post per day mixing proof (builds, results), education (how-to), and belief-shifting (why the old way is dead). For each day: hook line + 1-sentence angle. Optimize for one goal — being the obvious person to call in this niche.

Want to go further?

This guide is the method. The **AI Workshop** is the business: the full Claude Code Masterclass, my JARVIS assistant build, 200+ skills, and the playbook for turning these builds into paying clients.
